

## Existing Digital Safety and Cybersecurity Services in South Asia.

South Asia already has many apps, websites, and service providers that work on digital safety, scam detection, and cybersecurity. However, most of them are either focused on enterprise security or built for one country only. Because of that, there is still a strong need for a more local, user-friendly, and multilingual solution.

### India

India has the most active market for AI-based scam detection and fraud protection. Some well-known platforms are **BharatSecure** ([bharatsecure.app](https://bharatsecure.app)), **Savdhaan AI** ([savdhaan.in](https://savdhaan.in)), **Phishbowl** ([phishbowl.in](https://phishbowl.in)), **PhishGuard** ([phishguard.co.in](https://phishguard.co.in)), **RakshaAI** ([rakshaai.co](https://rakshaai.co)), and **ScamMukt** ([scammukt.com](https://scammukt.com)). These platforms mainly help users check suspicious links, SMS, WhatsApp messages, UPI IDs, QR codes, phone numbers, and email messages.

India also has multilingual scam detection experiments such as **IndicLang Fraud Shield**, which supports multiple Indian languages and works with WhatsApp and Telegram messages. This shows that the region is moving toward local-language digital protection tools.

### Bangladesh

Bangladesh has a growing cybersecurity service sector, but most providers are focused on business and government clients rather than ordinary users. Some important examples are **Brain Station 23** ([brainstation-23.com/cyber-security-company](https://brainstation-23.com/cyber-security-company)), **BugsBD Limited** ([bugsgbd.com/services](https://bugsgbd.com/services)), **Arena Web Security** ([arenawebsecurity.net](https://arenawebsecurity.net)), **Cyberlog** ([cyberlog.com.bd](https://cyberlog.com.bd)), and **BGD e-GOV CIRT** ([cirt.gov.bd](https://cirt.gov.bd)).

These organizations provide services such as vulnerability assessment and penetration testing, incident response, risk assessment, digital forensics, cyber threat intelligence, awareness training, and secure architecture support. Bangladesh also has national-level initiatives like **Bangladesh Cyber Security Intelligence (BCSI)**, which focuses on threat intelligence and cyber infrastructure protection.

## Nepal

Nepal also has several cybersecurity companies that mainly offer technical security services. Examples include **Greentick Consulting** ([gtm.com.np](http://gtm.com.np)), **EncryptSec** ([encryptsec.com](http://encryptsec.com)), **Envision Nepal** ([envisionnepal.com.np](http://envisionnepal.com.np)), **Cryptogen Nepal** ([cryptogennepal.com](http://cryptogennepal.com)), **Young Minds** ([youngminds.com.np](http://youngminds.com.np)), and **Qualitcert** ([qualitcert.com](http://qualitcert.com)).

Their services usually include VAPT, IT audits, SOC support, cloud security, compliance, and penetration testing. Most of them are business-oriented rather than consumer-facing.

## Sri Lanka

Sri Lanka has both government and private cybersecurity services. Important examples are **Sri Lanka CERT** ([cert.gov.lk](http://cert.gov.lk)), **NCSOC** ([ncsoc.gov.lk](http://ncsoc.gov.lk)), and **Ceylon Black Hat Force**.

These organizations provide monitoring, incident response, vulnerability assessment, penetration testing, digital forensics, application security, governance, and awareness support. Sri Lanka's model is a mix of national cyber defense and enterprise security.

## Common Service Types

Across South Asia, the most common digital safety services are:

- Scam and phishing detection.
- Link, QR, email, and SMS verification.
- VAPT and penetration testing.
- SOC and threat monitoring.
- Incident response and digital forensics.
- Awareness and cybersecurity training.

In simple terms, most services fall into either **consumer scam protection** or **enterprise cybersecurity**. India is stronger in consumer tools, while Bangladesh, Nepal, and Sri Lanka are stronger in professional security services.

## Scope for Improvement

- 1.**AI Scam DNA** – Analyze scam messages, language, and behavior to identify related scam campaigns or groups.
- 2.**Digital Twin Attack Replay** – Generate a visual, step-by-step replay of how the cyberattack happened.
- 3.**Cyber Risk Score** – Provide a post-recovery security score that predicts the user's future risk of compromise.
- 4.**Community Early Warning System** – Detect emerging scams from multiple user reports and instantly warn other users.
- 5.**Victim Knowledge Graph** – Connect accounts, evidence, scammers, and timelines into a single interactive investigation graph.
- 6.**Recovery Probability Predictor** – Estimate the likelihood of successful account recovery and expected resolution time.
- 7.**Emotional Distress Detection** – Detect panic or stress from user conversations and adapt support priority and communication style.
- 8.**Reverse Incident Search** – Match uploaded screenshots, links, or scam content against previously reported incidents.
- 9.**Family Cyber Shield** – Protect and monitor multiple family members' digital accounts from a single dashboard.
- 10.**On-Device Privacy AI** – Perform sensitive image and data analysis directly on the user's device without uploading personal content.
